

Generic data modeling pipeline — architecture

Transaction / LMO layer → EMO / elevated model layer → Snowflake semantic layer

What does this pipeline do?

Key benefits

No code changes needed

Add new tables or change formats by editing a JSON file — not the pipeline.

Data privacy built in

Sensitive fields are automatically masked before data leaves the pipeline.

Correct execution order

Dependencies are resolved automatically.
No manual ordering or scheduling needed.

Full audit trail

SCD Type 2 tracks every change with dates, so you can see what changed when.

Works with any storage

Delta Lake, Parquet, or Iceberg — the pipeline handles all formats seamlessly.

Safe, atomic writes

SCD Type 2 uses a single transaction — no partial updates if something fails.

Easy to extend

Need a new write strategy or format? Add one class and one line in the factory. Everything else stays untouched.
